Introduction

Personas and Levers

Persona 1- New Well Member

Jon

Jon is a widower living in rural Texas that has just been given Well from his employer.

Profile

- 60 years old
- Android user, not savvy
- Has diabetes, hypertension and high cholesterol
- Very spiritual
- Likes to swim weekly
- Has 2 grandkids that need financial help
- His wife recently passed away

Pains

- Diabetes management is poor
- Cost of medications is a concern/frustration
- Lonely despite close to family
- Nearest hospital is about an hour away
- Has had to go to ER twice in last year
- Doesn't understand his benefits
- Confused/frustrated with healthcare in general

Gains

- Hopes to earn \$ from Well
- Hopes health guides can help him with medication adherence like his wife did
- Excited to engage with "real people" to get straight answers to his questions
- Heard his family might benefit from his membership

Launch demo

Persona 2 - 3 Month Well Member

Sophia

Sophia is a young professional currently working from home that really wants to excel.

Profile

- 23 years old
- Tech savvy
- Works from home
- Budget conscious
- Balanced diet
- Drinks socially
- Single but dating
- Lots of stress & anxiety

Pains

- Doesn't have a doctor
- Worries about cost of healthy food
- Wants to work out but struggles with motivation
- She's looking for low cost ways to be healthy - not interested in gyms or apple watch
- Family history of hypertension
- New to employer benefits

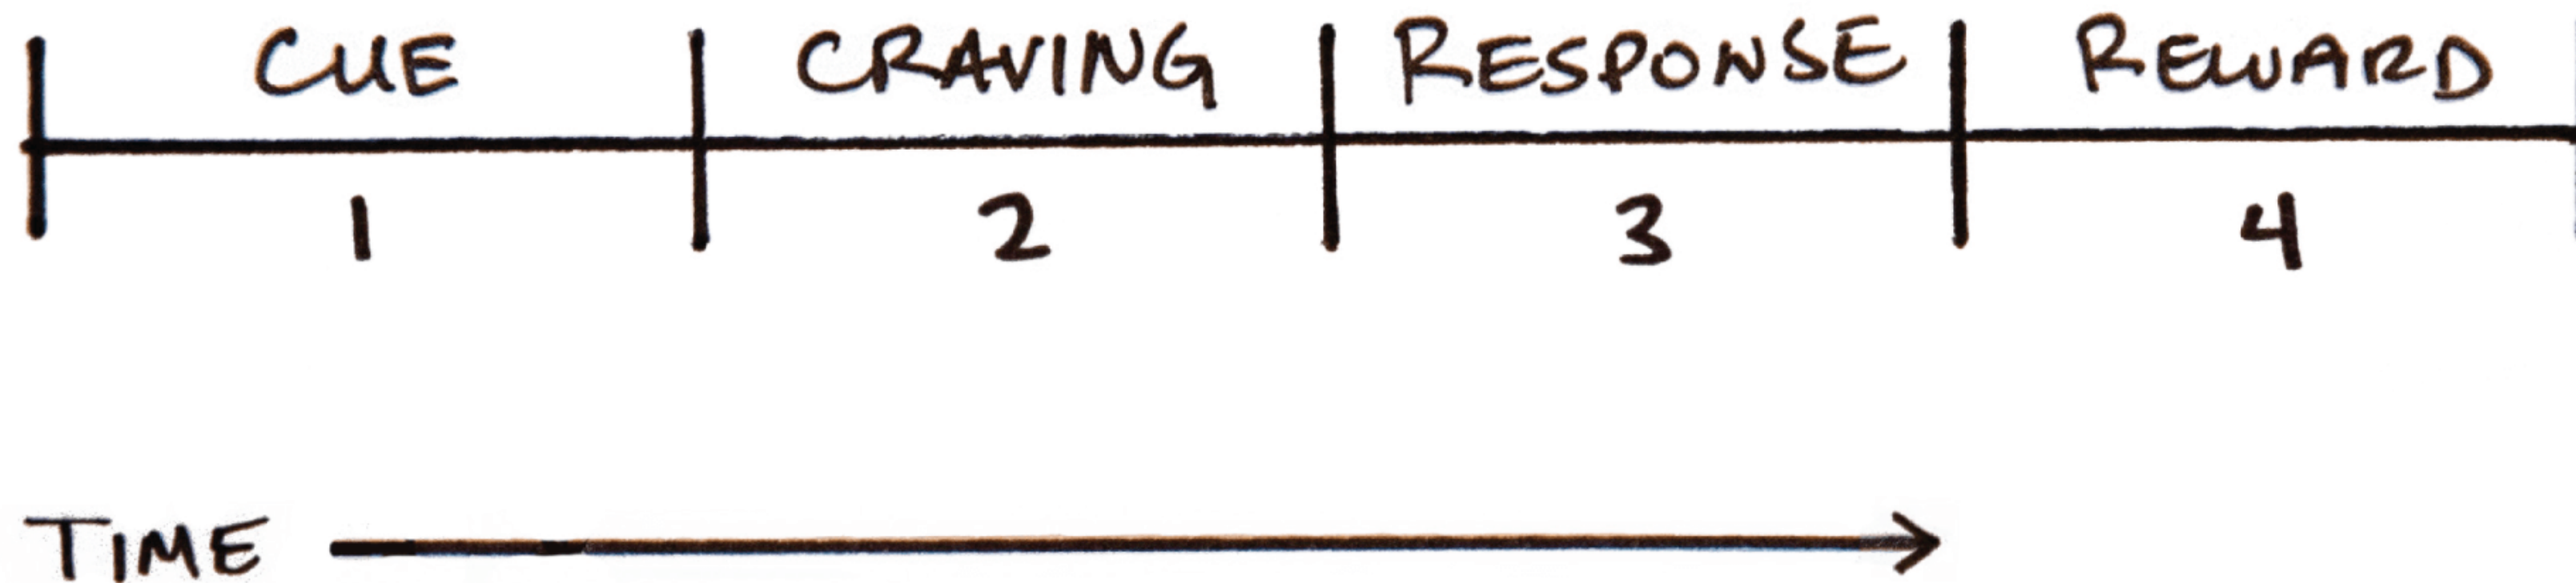

Gains

- Prevention of health issues
- Could benefit from tips and advice to do at home
- By making it fun her attention is kept
- Learns about quick, simple shifts vs huge life change
- Improve her feeling of wellness
- Improve her feeling of stress

Building Habits

THE FOUR STAGES OF HABIT

HEXAD User Types

Extrinsic Users- motivated simply because there are rewards at the end

Consumer

Consumers will do what is needed to get rewards. If that requires them to learn new skills or take on challenges, then they will do it. However, if they can get rewards for just doing what they were already doing – even better.

Self-Seeker

They will answer questions and help others, but purely to get rewards and visible status from the system. Quantity over quality – unless quality gets them more rewards. They are uninterested in the social aspect of users.

Networker

Networkers are looking for useful contacts that they can gain from. They want social connections, but to give them some form of status or reward.

Intrinsic Users - motivated because actions are personally rewarding to them; find a purpose in using the app without need of rewards

Socializer

Want to interact with others. They like to be connected to others. They are interested in parts of the system that help them do this. These are the ones will evangelise your internal social networks. Most motivated by the social connections aspects of relatedness.

Achiever

Motivated by Mastery. They are looking to learn new things and improve themselves. They want challenges to overcome. Will compete with others, but as a way to become better than others. The system provides the platform, other “players” are just things to be overcome and mastered. May also be motivated by status as a representation of their personal achievement

HEXAD User Types

The goal is to convert extrinsic users to intrinsic users.

“Make the system appealing to the four basic intrinsic motivations and user types, make it social and meaningful, and give the users some freedom. Once this structure is established, a thoughtful system of rewards can be integrated. If well designed, the overall system won’t depend on the rewards to function effectively. This will intrinsically motivate the Non-Players, while indulging the Players – with rewards.”

mHealth

MOBILE HEALTH USER PERSONAS BY KETCHUM

mHealth Users

Discerning Digitals: These are the super users who love being constantly connected, but may also struggle with feeling too available. They are advocates of mHealth but still like face-to-face contact with medical professionals.

Swayable Seekers: This group wants to expand their smartphone repertoire beyond just making calls. They feel confident about managing their health and get a lot of their medical info online. The majority feel like they have a lot to learn about using mobile tech for their health.

Health Tech Hesitators: This group admits they don't manage their health very well and aren't happy with their physical well-being, and they're not exactly comfortable sharing information online either.

App-athetic Agnostics: These people love mobile technology; many just don't use any type of mHealth, nor do they care to in the next year.

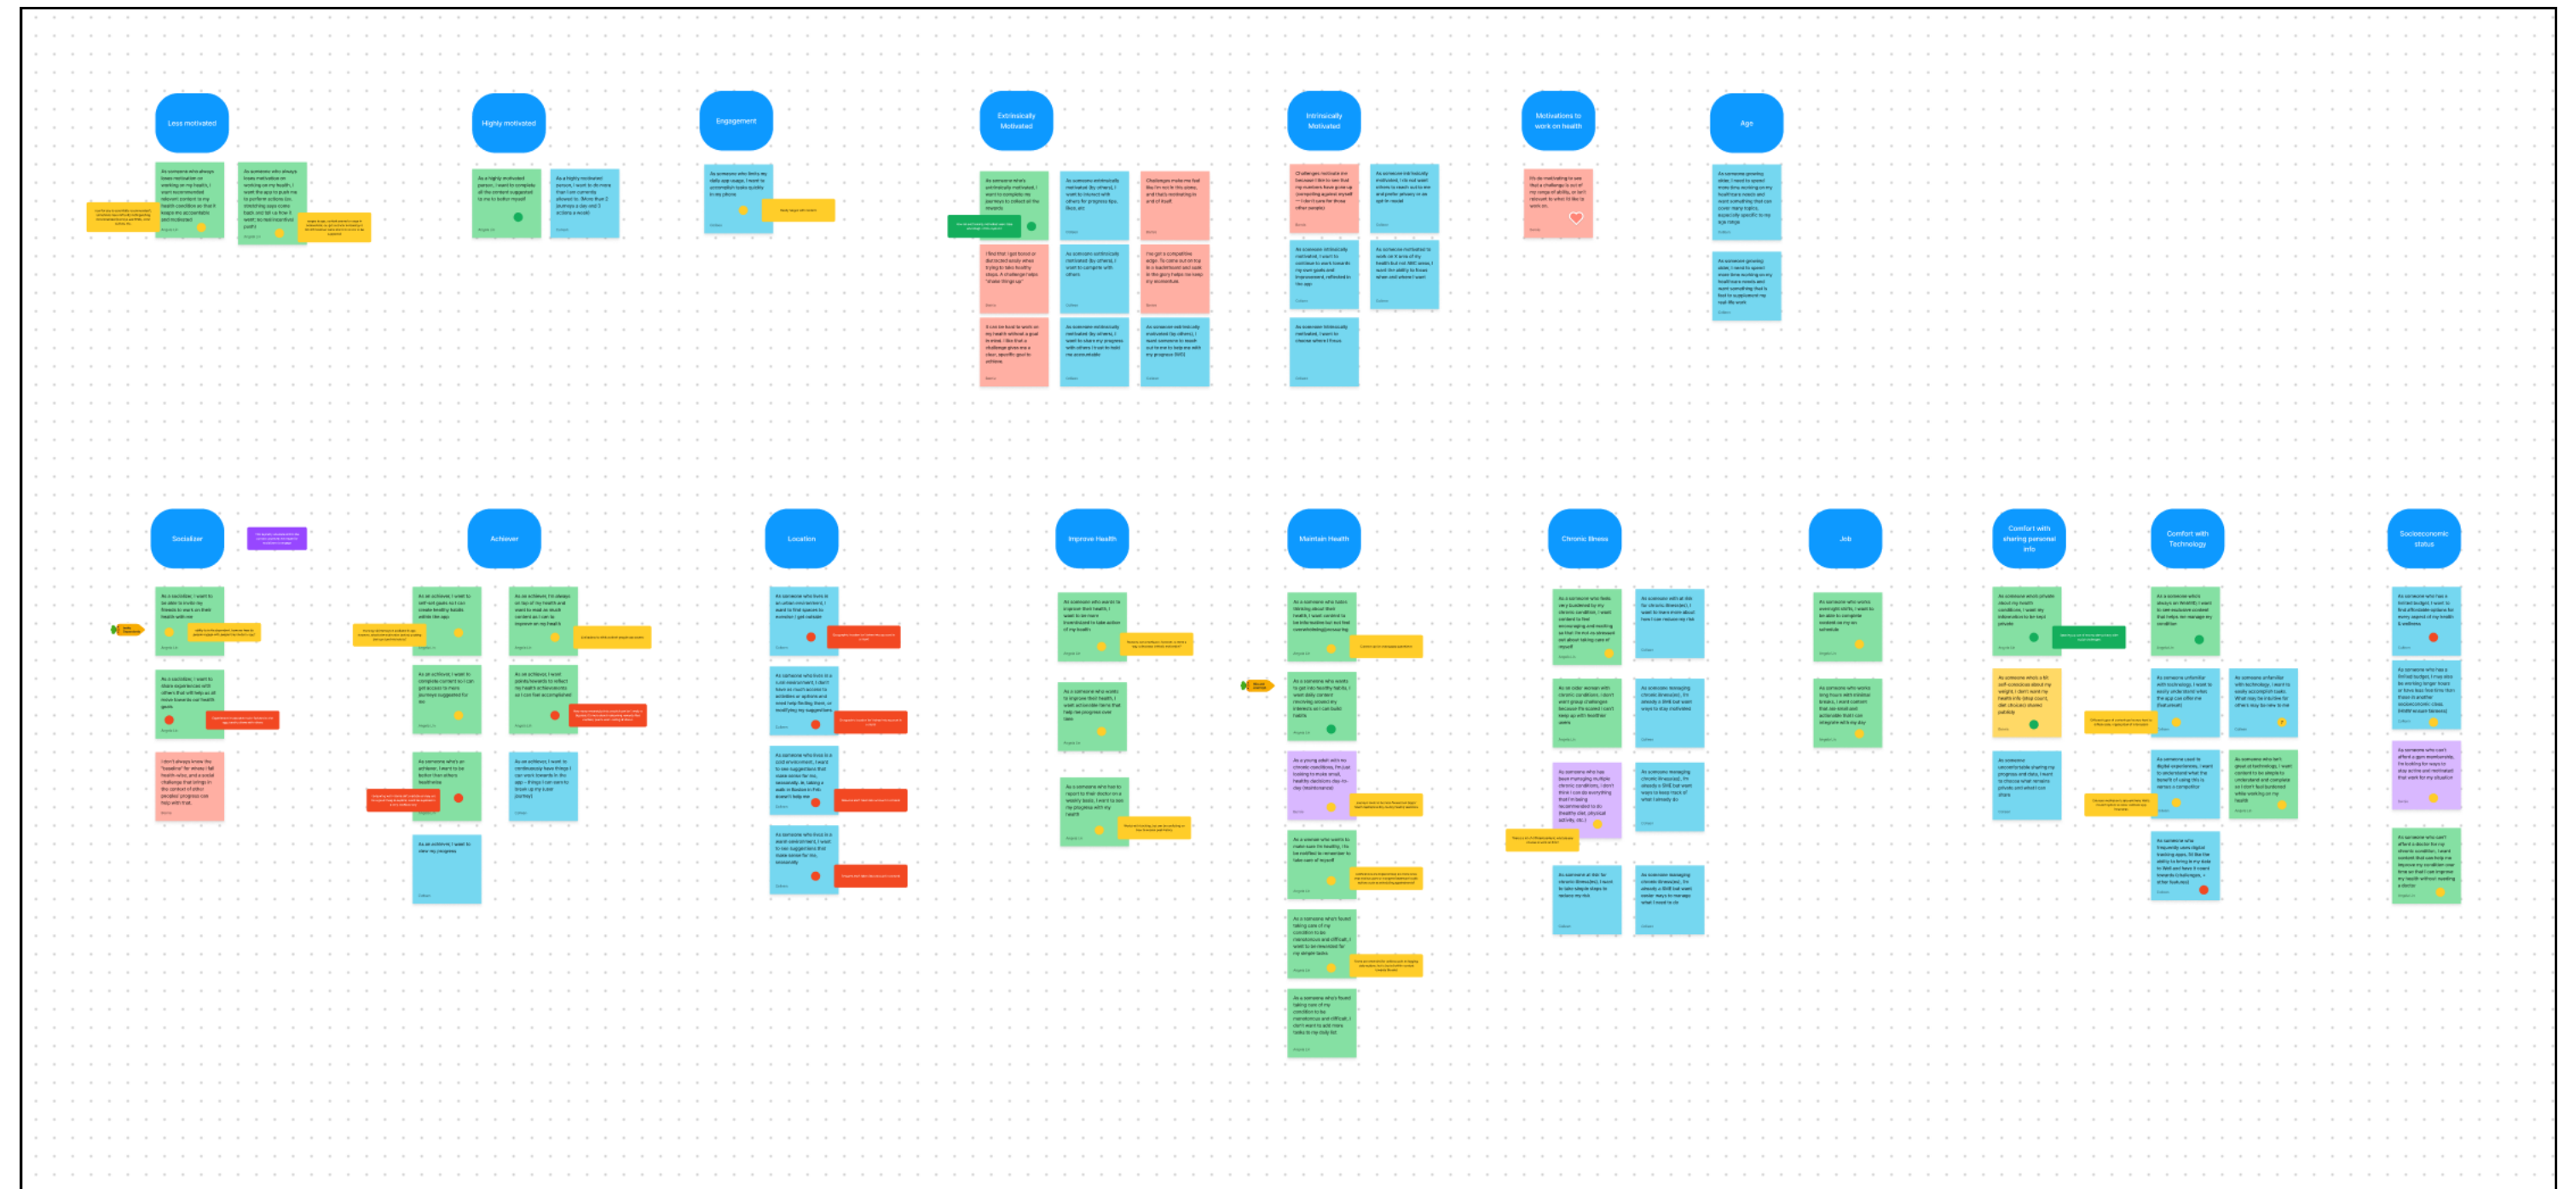

Low-tech Lifers: These are the traditionalists who don't think mHealth has had a positive impact on their lives, nor do they foresee it having a positive impact in the future.

User Levers

LEVERS DEVELOPED BY OUR TEAM

User “Levers”

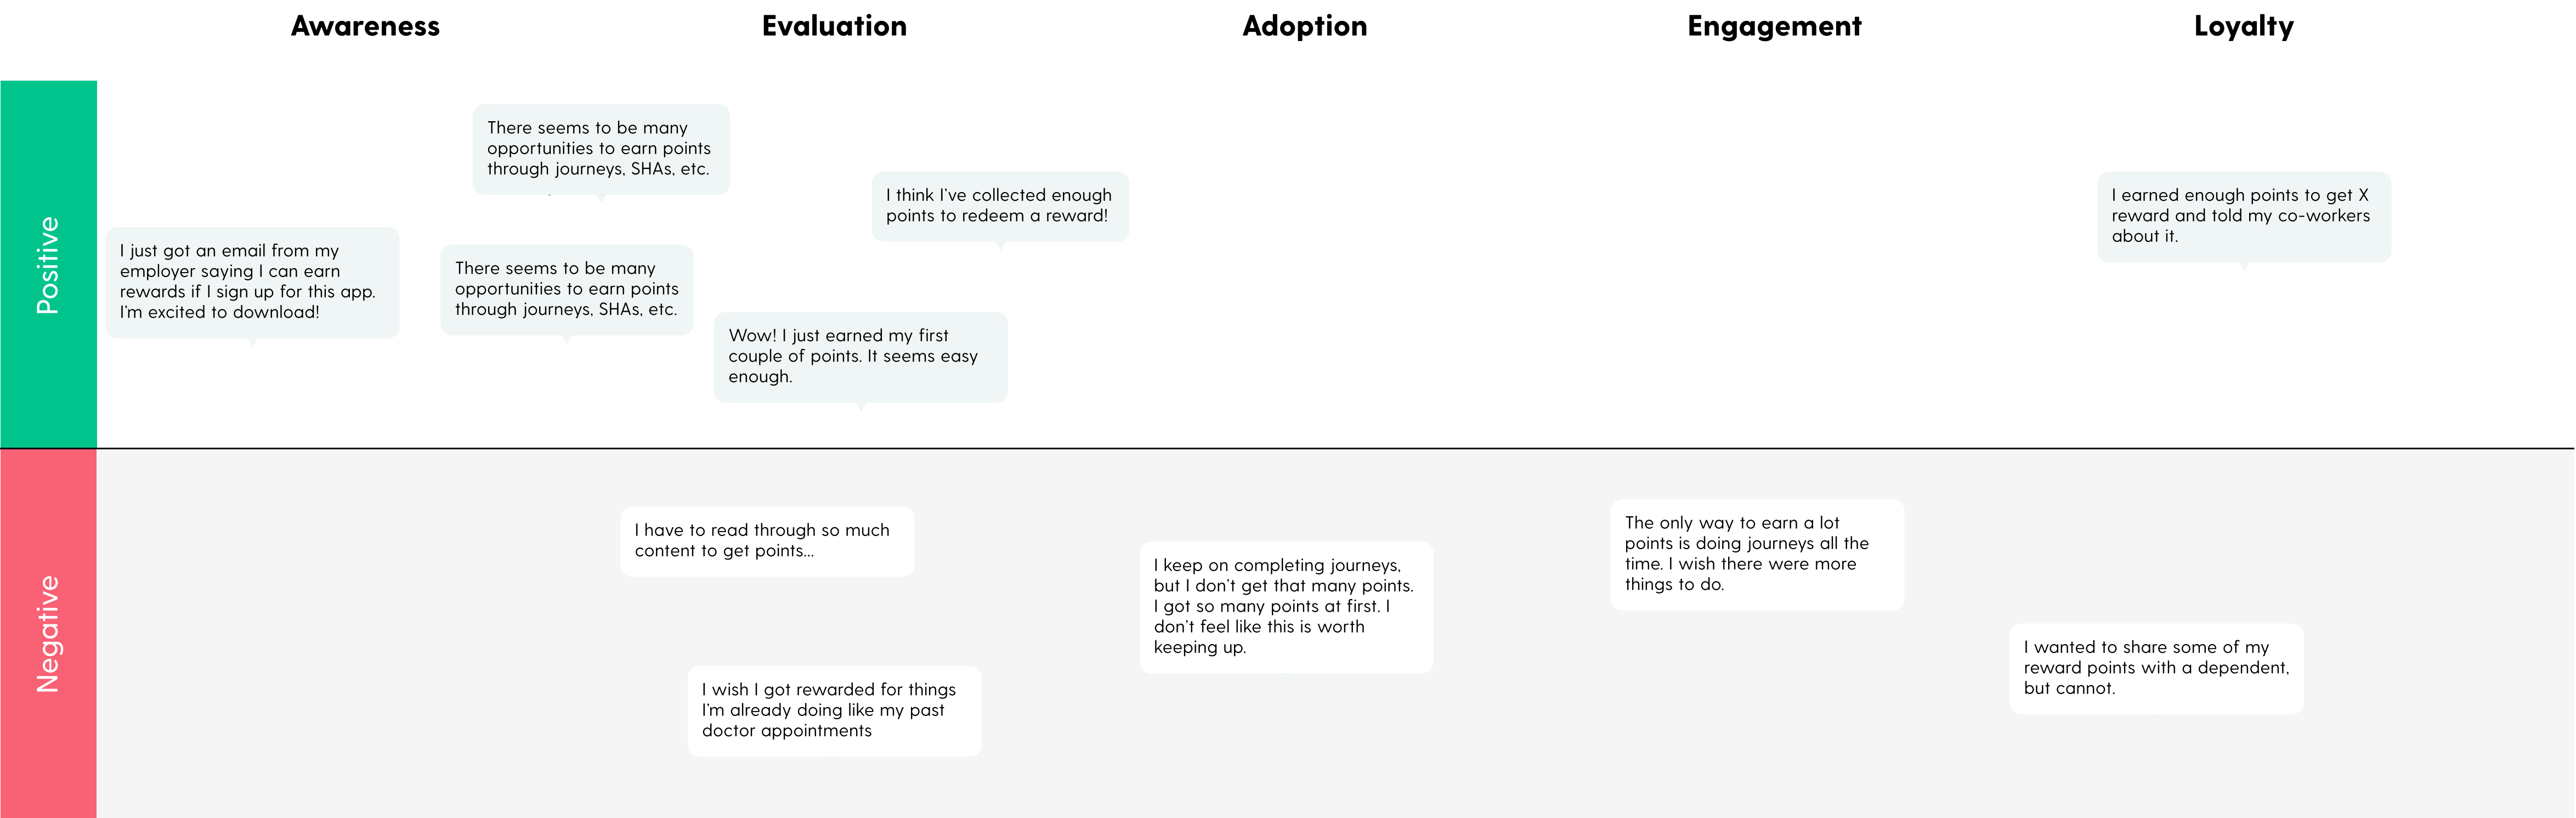

- Age
- Location
- Socioeconomic Status
- Job
- Chronic Illness
- Engagement
- Comfort with Technology
- Extrinsic/Intrinsic
- Achiever/Socializer
- Motivations
- Comfort with sharing personal info

User Stories

Extrinsic user

Motivator: external rewards
Wants/needs: a lot of rewards, to know they've earned all they can
Expectations: many opportunities to earn rewards, various ways to earn rewards

Conclusion:

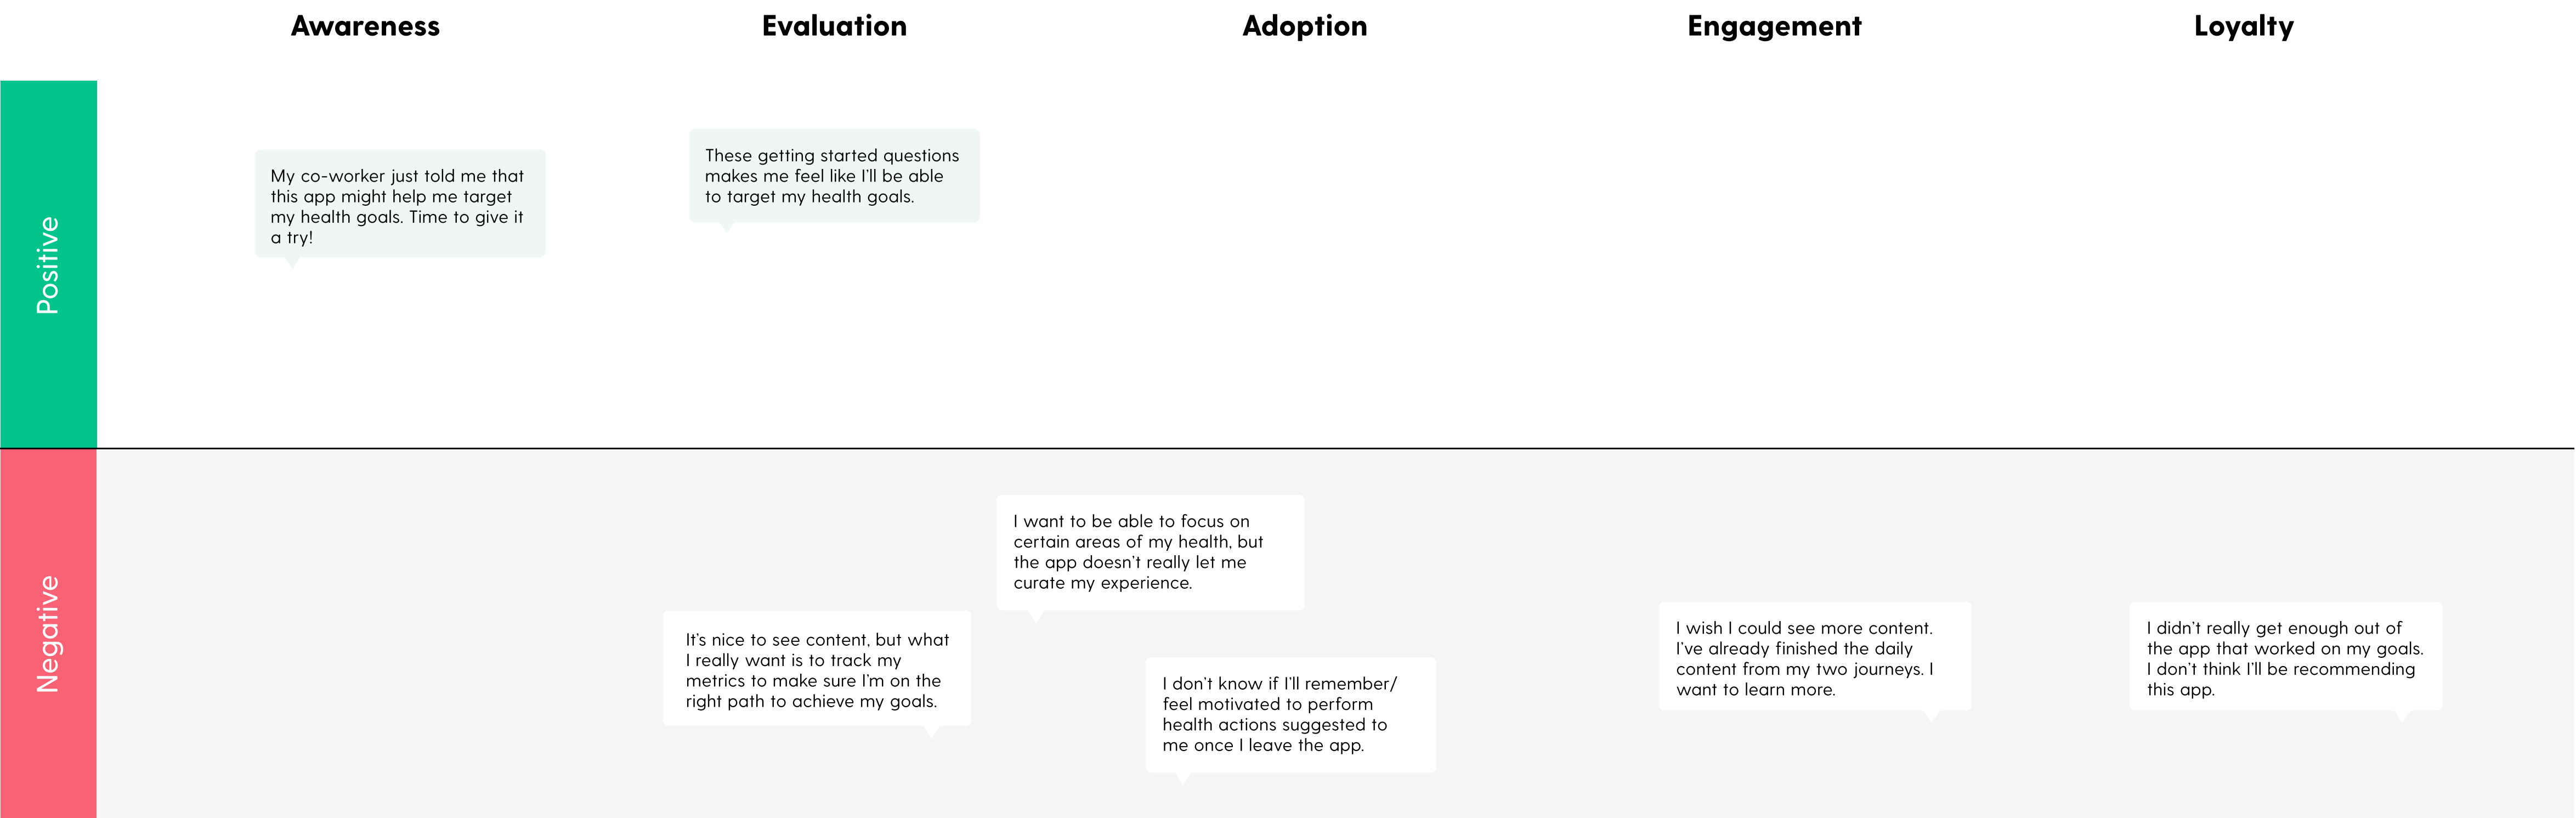

- Earlier experience caters to extrinsic expectations, but...
- Long-term engagement suffers due to limited ways of earning rewards

Opportunities:

- Easier ways to earn points
- More diverse/varied ways to earn points long-term
- Earn loyalty points for (sharing) making others aware of the platform

Intrinsic user

Motivator: achieve my health goals (do something to take care of my health)
Wants/needs: real advice, changes they can actually make/do, a way to hold themselves accountable, help with motivation
Expectations: set goals, guidance on how to achieve goals, see progress towards goals, accountability

Conclusion:

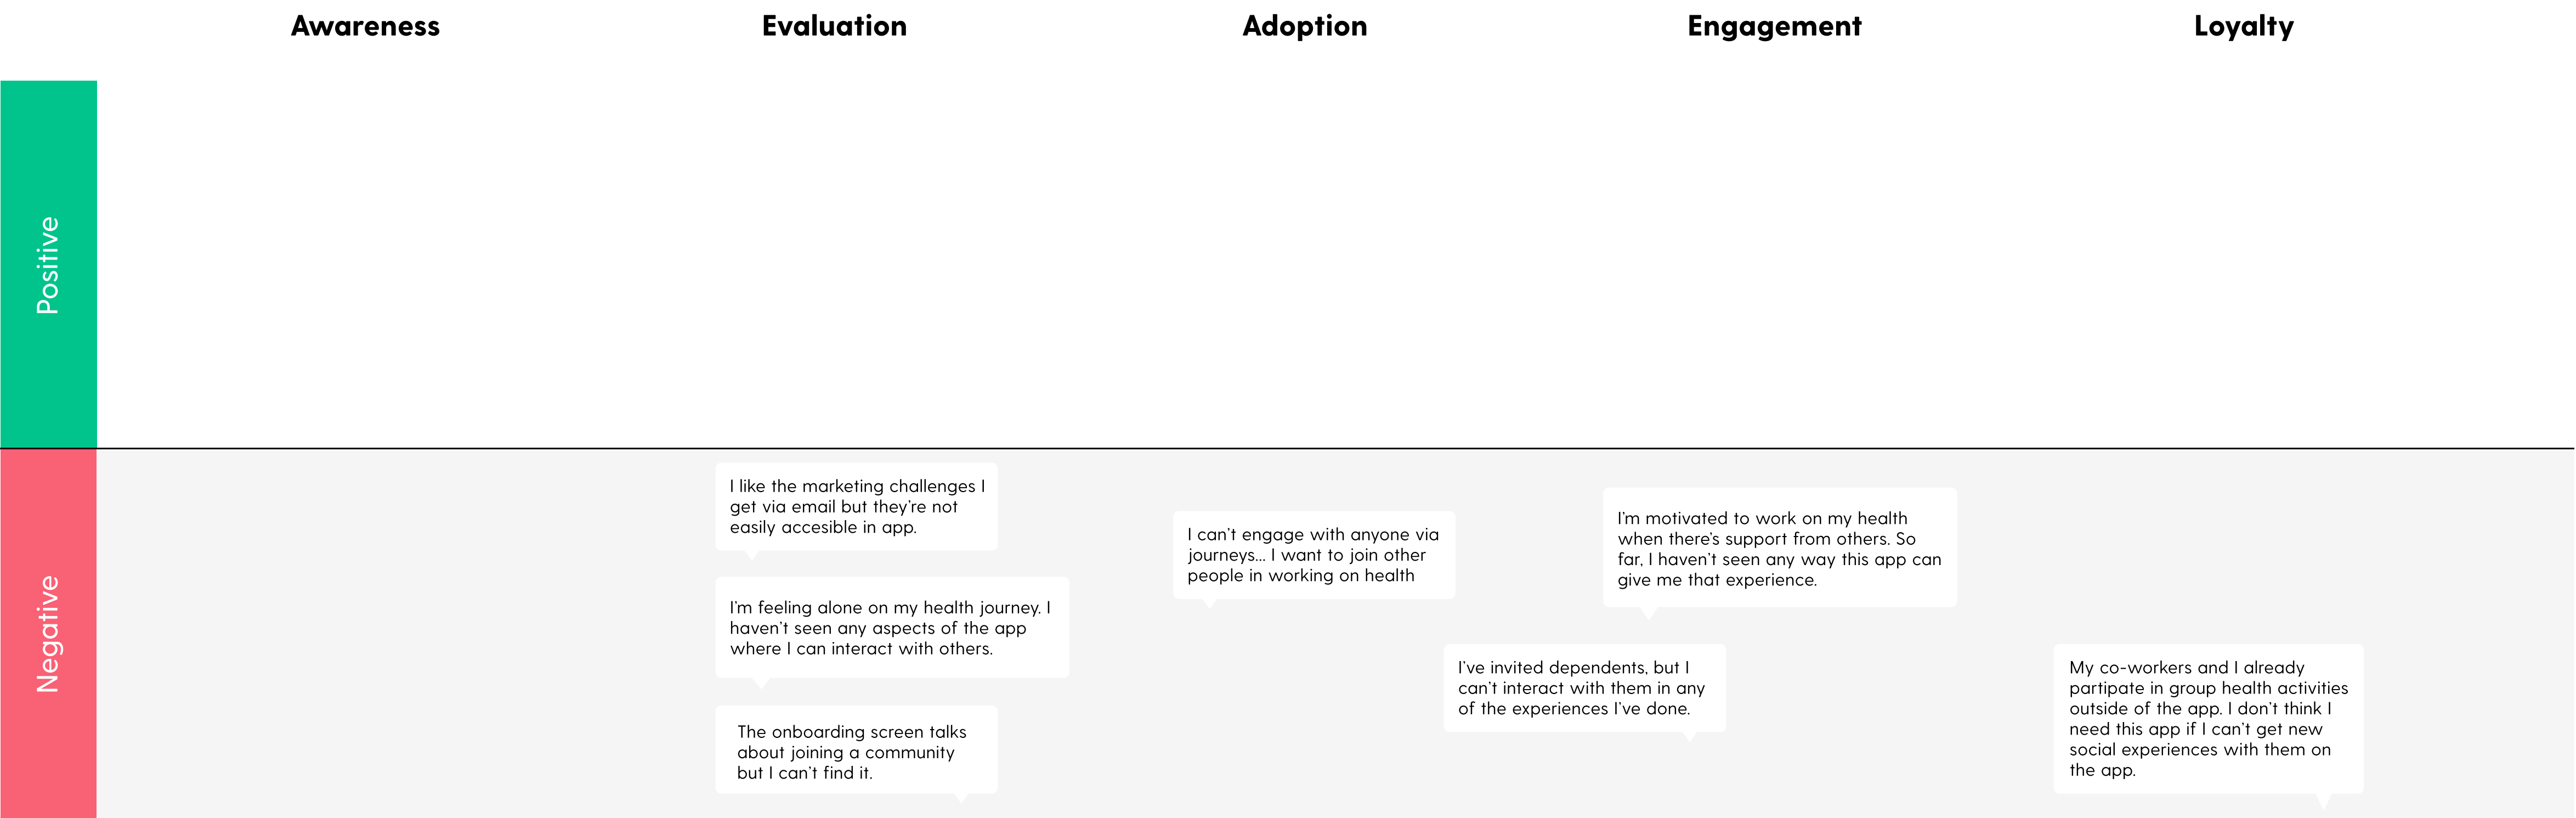

- Our journeys are tailored to ongoing Engagement, but there aren't many experiences that target Intrinsic user wants/needs that are ideal for the Evaluation and Adoption

Opportunities:

- New user Intrinsic experiences that allow lower investment and buy-in for users to try-on the App during the Evaluation and Adoption phases
- More choice over experiences
- Non-monetary rewards that incentivize progress

Socializer

Motivator: interactions with others
Wants/needs: community, support with their health journey through peers, a place to interact with others
Expectations: work with a community to encourage each other, participate in group experiences

Conclusion:

- No experiences in-app for socializers at the moment

Opportunities:

- Ways to connect and visibility into different communities (co-workers, random, etc.)
- Ways for members to feel supported by others in app

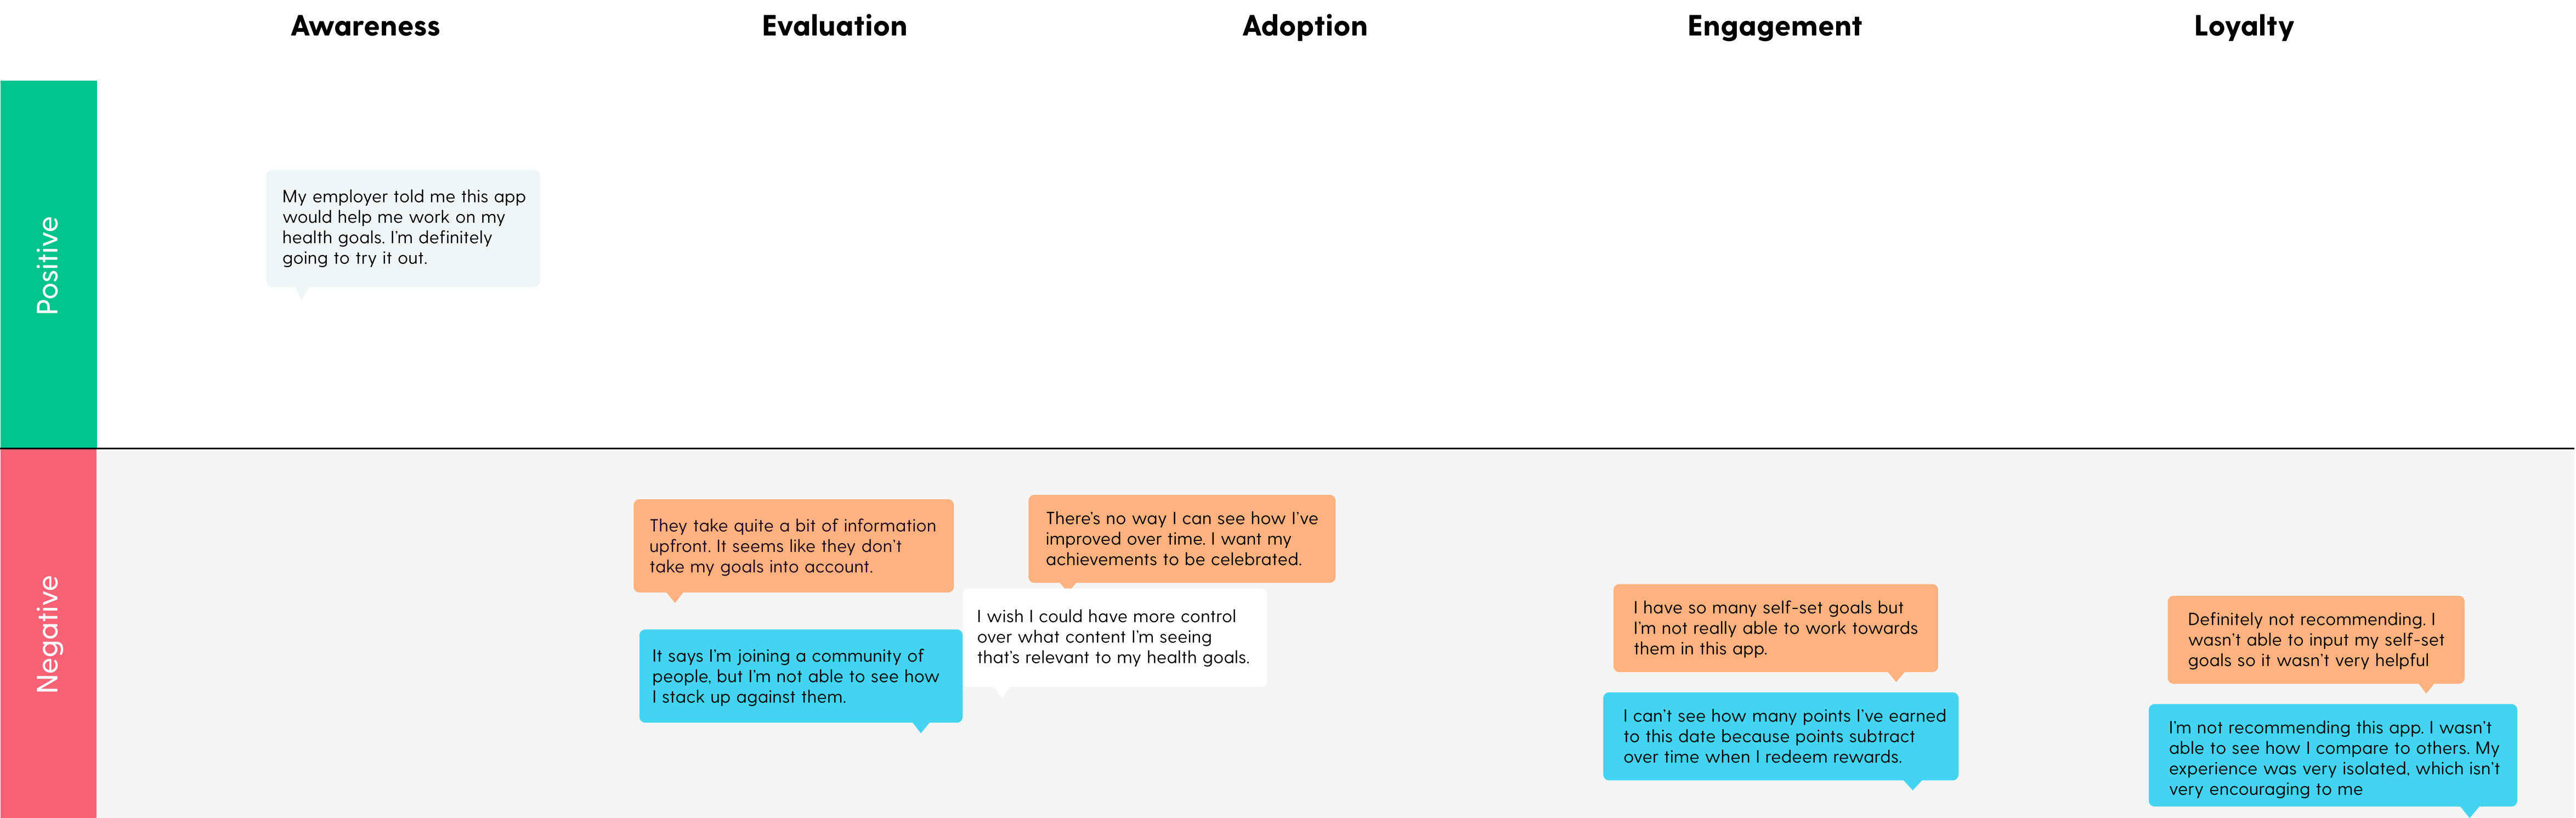

Achiever

Achiever 1

Motivator: mastery of health goals
Wants/needs: compete against self, ability to hold self accountable, track goals, complete health goals in timely fashion
Expectations: set goals, guidance on how to achieve goals, see progress towards goals, accountability

Achiever 2

Motivator: be better than others
Wants/needs: compete against others
Expectations: see how they compare to others

- Conclusion:
- Achiever 1
 - current experiences aren't tailored for self-set goals
 - doesn't hold the user accountable for goals
 - Achiever 2
 - no opportunities for users to compete with others

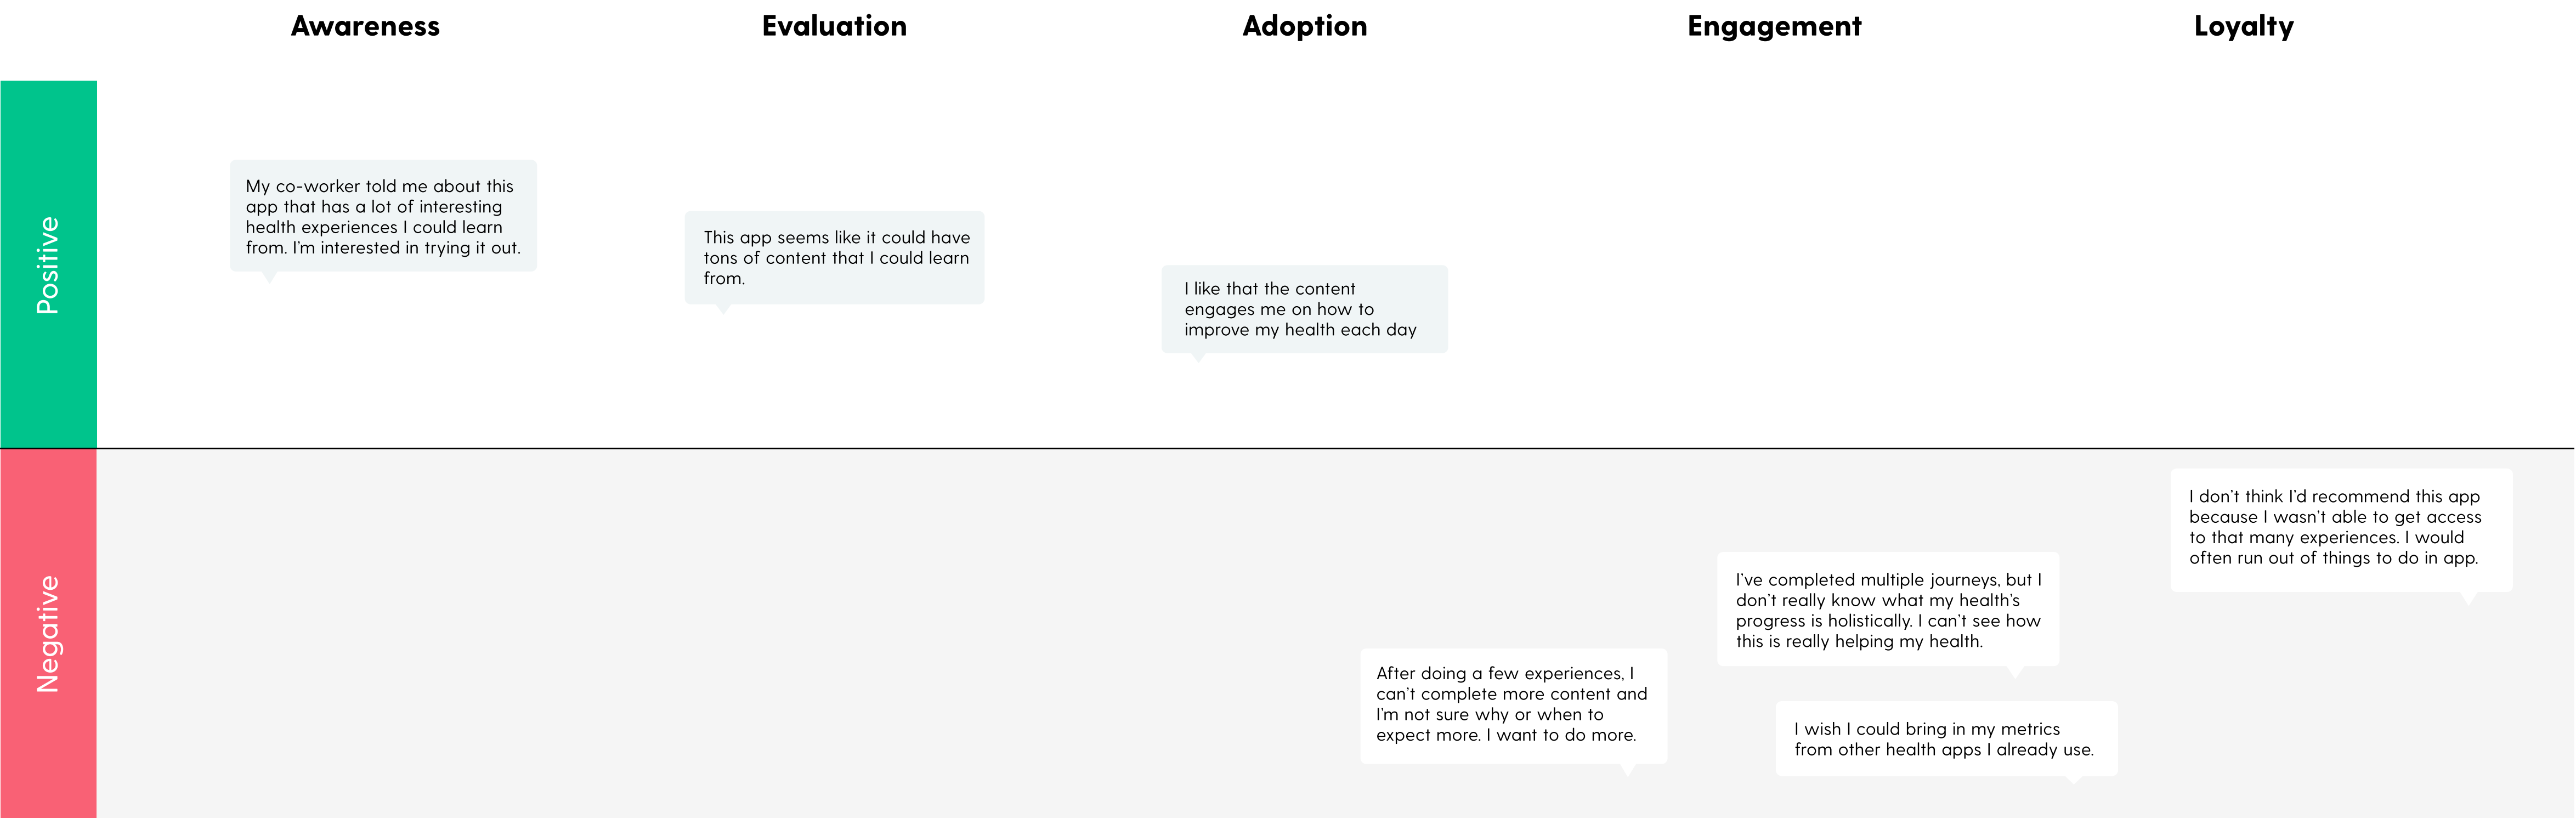

- Opportunities:
- Achiever 1
 - more choice over what they do
 - see progress over what they do
 - Achiever 2
 - ability to compare with others

Power User

Motivator: health-obsessed, always thinking about and acting for their health

Wants/needs: high volume of experiences, unique daily experiences, exploration (to leverage as many resources as they can to focus on their health)

Expectations: access to many different experiences, can engage with app for long periods of time throughout day, constant stream of new things to be doing for their health

Conclusion:

- Lack of control over content volume won't satisfy members
- Limitations in technology and utility of the app in achieving their focus/goals
- Early app experiences present volume/potential, but fails to truly distinguish the app's purpose and relevance to the individual user

Opportunities:

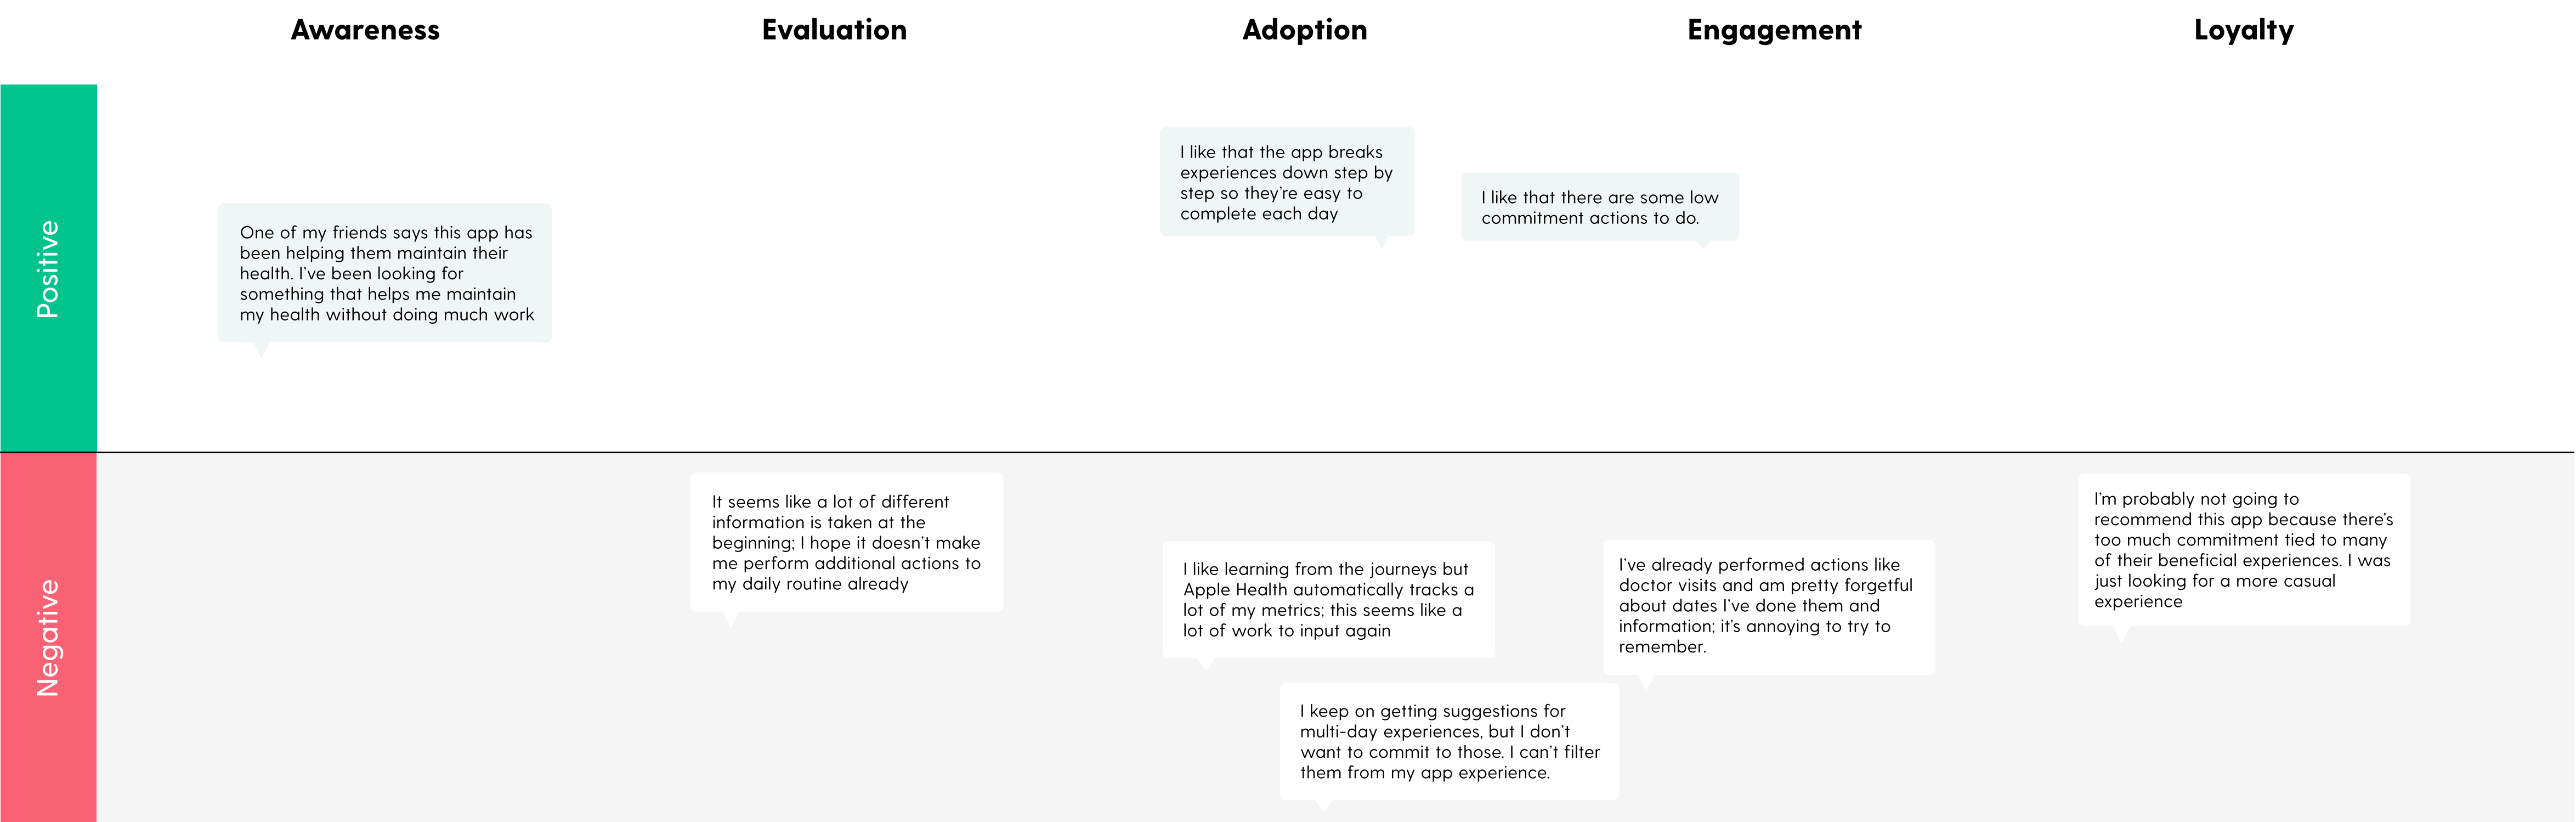

- control over experience volume
- visibility into progress
- experiment with non-monetary rewards
- provide more utility, less ambiguity about what to do
- offer more easy-adoption experiences, and introduce prescriptive actions/content later as the trust/**dependency** on the platform grows

Casual User

Motivator: more curious than driven, willing to try because they know it's the right thing to do

Wants/needs: short but beneficial experience, low commitment experiences

Expectations: small actions that help maintain health, see steady improvement over time without that much commitment, easy “wins”, don't want to be dependent on constantly being in app

Conclusion:

- Current experience favors high commitment experiences

Opportunities:

- more low commitment experiences
- more outside-the-app experiences
- less pressure on users to commit to high commitment experiences (current experience alienates anyone that doesn't feel major change is what they are looking for in the form of journeys)
- expectation setting on level of commitment

Takeaways

Takeaways

We need to consider that features appeal to different audiences. What motivates some users might not motivate others. It's ok for members to be interested in different feature sets.

When creating new features or revising features, we should identify which audience types to prioritize.

Next Steps

Process for UX

1. Plan design thinking workshop to come up with priority audience, problems, opportunities, hypotheses and experiments
2. Cursory UX designs (wires, etc.)
3. Pre-market User testing
4. Reflection
5. Iteration and MVP requirements
6. Design UX/UI
7. Implementation

Process for PMs

1. Consider audiences when creating or revising new feature requests
2. When writing PRDs, define audiences with UX team
